

DAY 5

1. On your Windows laptop or PC, open 'System Information' and take a screenshot showing your OS version, processor, and RAM details.

2. Download any official Linux distribution ISO (like Ubuntu or Fedora), and use Rufus or Balena Etcher to create a bootable USB drive for installation. Hint If you don't have a spare USB, use a virtual machine tool like VirtualBox to mount the ISO and start the installation process virtually.

>>

Step 1: Download the Linux ISO File

Open a web browser and visit the official Ubuntu website. Download the latest Ubuntu Desktop ISO file and save it on the computer.

Step 2: Install VirtualBox

Download and install Oracle VirtualBox on the Windows computer. After the installation is complete, launch the VirtualBox application.

Step 3: Create a New Virtual Machine

Click New in VirtualBox. Enter the virtual machine name (for example, *Ubuntu*), select Linux as the operating system and Ubuntu (64-bit) as the version.

Step 4: Allocate Memory and Create a Virtual Hard Disk

Assign at least 4 GB (4096 MB) of RAM to the virtual machine. Create a new virtual hard disk (VDI format) with a size of 25 GB or more.

Step 5: Mount the Ubuntu ISO File

Open the virtual machine Settings, select Storage, click the Empty optical drive, and choose the downloaded Ubuntu ISO file. This mounts the ISO as a virtual DVD.

Step 6: Start the Virtual Machine

Click Start. The virtual machine boots from the Ubuntu ISO, and the Ubuntu installation screen appears. Select Try or Install Ubuntu to begin the installation process.

Step 7: Verify the Installation Process

The Ubuntu installer starts successfully, confirming that the ISO file is valid and bootable. The installation process is now ready to continue inside the virtual machine.

- 3. On a macOS device (or using a macOS virtual machine), open 'System Preferences' and change the desktop wallpaper, then adjust the system language to Hindi or Gujarati Hint: Find 'Language & Region' in System Preferences to add or change languages.**

>>

Step 1: Start the macOS Device or Virtual Machine

Turn on the macOS computer or launch the macOS virtual machine and log in to your account.

Step 2: Open System Settings (System Preferences)

Click the Apple () menu in the top-left corner of the screen and select System Settings (or System Preferences on older versions of macOS).

Step 3: Change the Desktop Wallpaper

In System Settings, click Wallpaper (or Desktop & Screen Saver on older versions of macOS). Browse the available wallpapers or select a picture from your computer, then click the desired image to set it as the desktop background.

Step 4: Open Language & Region

Return to the main System Settings window and select Language & Region from the list of settings.

Step 5: Add Hindi or Gujarati

Click the + (Add) button under Preferred Languages. Search for Hindi or Gujarati, select the language, and click Add.

Step 6: Set the New Language

When macOS asks whether you want to use the selected language as the primary system language, click Use Hindi or Use Gujarati. Restart the Mac if prompted so the language change can take effect.

Step 7: Verify the Changes

After restarting, check that the new wallpaper is displayed on the desktop and that menus, buttons, and system text appear in the selected language (Hindi or Gujarati). This confirms that both changes were applied successfully.

- 4. Install a fresh copy of Ubuntu Linux (real or virtual machine) and create a new user account named 'gamer'. After installation, enable automatic login for this user and take a screenshot of the login screen showing the username.**

Step 1: Download Ubuntu

First, I downloaded the latest Ubuntu Desktop ISO file from the official Ubuntu website.

Step 2: Create a Virtual Machine

I opened VirtualBox (or VMware) and created a new virtual machine. I assigned 4 GB of RAM, 25 GB of virtual hard disk space, and selected the Ubuntu ISO file as the startup disk.

Step 3: Start the Installation

I started the virtual machine and selected Install Ubuntu from the welcome screen.

Step 4: Choose Language and Keyboard

I selected English as the installation language and chose the appropriate keyboard layout.

Step 5: Select Installation Type

I selected Normal Installation and enabled the option to install updates and third-party software during installation.

Step 6: Disk Setup

I selected Erase disk and install Ubuntu because it was a new virtual machine with an empty virtual hard disk. Then I clicked Install Now and confirmed the changes.

Step 7: Select Time Zone

I selected my time zone and clicked Continue.

Step 8: Create the Initial User

I entered the required information:

- Your Name: Student
- Computer Name: ubuntu-pc
- Username: student
- Password: *****

Then I clicked Continue to begin the installation.

Step 9: Complete Installation

Ubuntu copied the required files and completed the installation. After it finished, I restarted the virtual machine and removed the installation media when prompted.

Step 10: Create a New User Named gamer

After logging in, I opened Settings → System → Users. I unlocked the settings using the administrator password and clicked Add User. I created a new user with the following details:

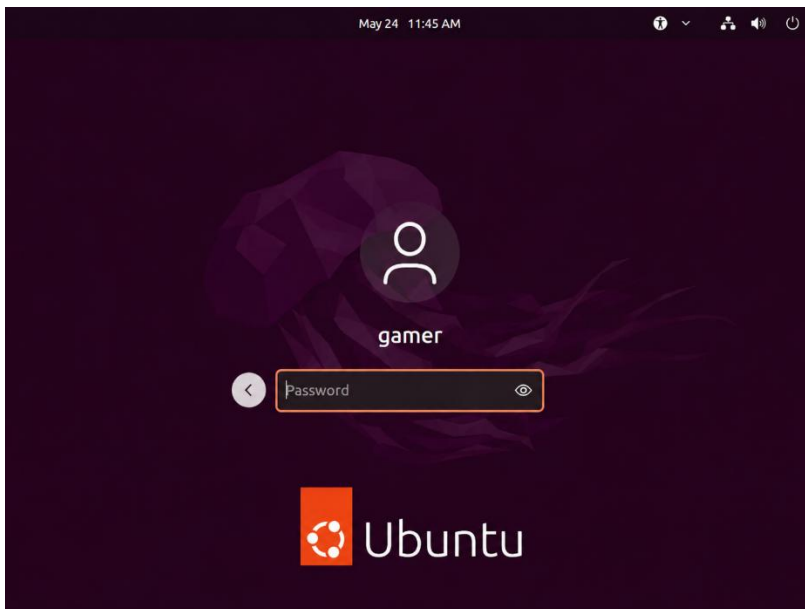

- **Username:** gamer
- **Password:** (chosen during setup)

Step 11: Enable Automatic Login

In the Users settings, I selected the gamer account and turned Automatic Login On.

Step 12: Verify the Setup

Finally, I restarted the system. The login screen displayed the gamer user account, confirming that the new account had been created successfully and automatic login had been enabled.

5. Use ChatGPT to generate a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates. Follow the guide and note any steps that were unclear or missing.

>>>

Step 1: Download Windows 10

Download the Windows 10 Media Creation Tool from Microsoft's official website and create a bootable USB drive (minimum 8 GB).

Step 2: Boot from the USB Drive

Insert the bootable USB into the laptop, restart it, enter the BIOS/UEFI settings (using keys like F2, F12, or Delete), and set the USB drive as the first boot device.

Step 3: Start Windows Setup

When the Windows Setup screen appears, select the language, time and currency format, and keyboard layout. Click Next, then select Install Now.

Step 4: Choose Installation Type

Enter the product key if available, or click I don't have a product key. Select the correct Windows edition, accept the license agreement, and choose Custom: Install Windows only (advanced).

Step 5: Partition the Drive

Select the destination drive. If it is a new drive, create a new partition. If reinstalling Windows, delete old partitions only after backing up important data. Select the primary partition and click Next.

Step 6: Complete the Installation

Windows will copy files, install features, and restart the laptop several times. After installation, choose your region, keyboard layout, and create or sign in to a user account.

Step 7: Configure Privacy Settings

Review the privacy options. Turn off features you do not need, such as Location, Advertising ID, Optional Diagnostic Data, and Tailored Experiences. Allow only the permissions you want to share.

Step 8: Install Updates and Drivers

Open Settings → Update & Security → Windows Update and install all available updates. Restart the laptop if required, then install any missing drivers and essential software.
